## Smart Anchor Monitor (SAM)

The Smart Anchor Installation Monitor is the latest in technological advances in guy anchor installation monitoring and recording. The SAM torque indicator monitors and records installation torque, RPM, angle, depth and GPS coordinates of helical guy and foundation anchors. This unique device provides a permanent record of all helical anchor installations for contractors and engineers alike.

With the SAM, no longer do linemen and engineers have to rely on ineffective torque indicators or rules of thumb. Shaft twist, shear pin indicators and pressure gauges are becoming obsolete due to their inability to provide accurate information and no permanent record of installation. The wireless Smart Anchor Monitor not only makes monitoring the installation easy but also downloads and stores information directly to spreadsheet software for a permanent installation record.

The Smart Anchor Monitor displays and records:

- Installation Torque
- Installation Angle
- Installation Depth
- Installation Speed (RPM)
- Installation Coordinates (GPS)

Accurate helical anchor installation monitoring is necessary to provide installers a record of installation information and proof of quality workmanship. This same installation record will provide engineers comfort that the anchors are installed to their specifications and can even save on material costs. The Smart Anchor Monitor is a rugged device that mounts directly to current tooling and can be easily between multiple pieces of equipment.
