## Catch Basins & Drains

The ECP Catch Basins are designed as a collection point for water runoff, whether in landscape planting areas, downspout discharge or sump pump outlets the use of a catch basin will increase the efficiency and provide options for your total drain solution. Controlling rain water runoff is the most important factor when it comes to keeping your home dry.

A catch basin is your first line of defense against rain water. Whether installed under downspouts or in planted areas catch basins collect water and then with the aid of the ECP Drain Pipe System water is redirected away from the structure. ECP Catch Basins are the ideal method of downspout drainage. Mounted directly under the downspout with a heavy duty grating system water will flow unobstructed into a subsurface drain pipe and away from your basement, preventing basement flooding.

The grates of the ECP Catch Basins are designed to filter out leaves, sticks and debris that can clog drain pipes. The grating system also prevents pipes from cracking in the winter due to freezing temperatures. By simply clearing off the grate your drainage system will stay open and function properly for many years to come.

Available in low profile and standard versions the ECP Catch Basins can be sized and fitted to most applications and flow rates. Our catch basins can be installed in combination with one another to overcome obstacles and provide a controlled discharge of water.
